## **Handbook of Thermodynamic Diagrams**

- Volume 1: C<sub>1</sub> to C<sub>4</sub> Compounds (Product #5857)
- Volume 2: C<sub>5</sub> to C<sub>7</sub> Compounds (Product #5858)
- Volume 3: C<sub>8</sub> to C<sub>28</sub> Compounds (Product #5859)
- Volume 4: Inorganic Compounds and Elements (Product #5860)

*Carl L. Yaws*

Each of the above series contains data for more than 1,000 organic compounds, including hydrocarbons, oxygenates, halogenates, nitrogenates, sulfur compounds, and silicon compounds. The data are presented in graphs for *vapor pressure*, *viscosity*, *thermal conductivity*, or *thermodynamics* as a function of temperature and are arranged by carbon number and chemical formula to enable the engineer to quickly determine values at the desired temperatures. Select series include wide ranges of inorganic compounds and elements.

---

## **Handbook of Transport Property Data** (Product #5392)

*Carl L. Yaws*

Comprehensive data on viscosity, thermal conductivity, and diffusion coefficients of gases and liquids are presented in convenient tabular format.

---

## **Physical Properties of Hydrocarbons**

- Volume 1, Second Edition (Product #5067)
- Volume 2, Third Edition (Product #5175)
- Volume 3 (Product #5176)
- Volume 4 (Product #5272)

*R. W. Gallant and Carl L. Yaws*

The four-volume series provides chemical, environmental, and safety engineers with quick and easy access to vital physical property data needed for production and process design calculations.

---

## **Thermodynamic and Physical Property Data** (Product #5031)

*Carl L. Yaws*

Property data for 700 major hydrocarbons and organic chemicals, including oxygen, nitrogen, fluorine, chlorine, bromine, iodine, and sulfur compounds, are provided.

Mei Han	Graduate student, Chemical Engineering Department, Lamar University, Beaumont, Texas 77710, U.S.A.
Sachin D. Sheth	Graduate Student, Chemical Engineering Department, Lamar University, Beaumont, Texas 77710, U.S.A.
Carl L. Yaws	Professor, Chemical Engineering Department, Lamar University, Beaumont, Texas 77710, U.S.A.

# ACKNOWLEDGMENTS

Many colleagues and students have made contributions and helpful comments over the years. The author is grateful to each: Jack R. Hopper, Joe W. Miller, Jr., C. S. Fang, K. Y. Li, Keith C. Hansen, Daniel H. Chen, Fu-Ming Tsuo, Jeng-Shia Cheng, San-Min Chou, J. W. Via, III, P. Y. Chiang, H. C. Yang, Xiang Pan, Xiaoyan Lin, Duane G. Piper, Jr., Li Bu, Sachin D. Nijhawan, Sachin D. Sheth, and Mei Han.

The author wishes to acknowledge special appreciation to his wife (Annette) and family (Kent, Michele, Chelsea, and Brandon; Lindsay and Rebecca; and Matthew and Sarah).

The author wishes to acknowledge that the Gulf Coast Hazardous Substance Research Center provided partial support to this work.

## DISCLAIMER

This handbook presents a variety of thermodynamic and physical property data. It is incumbent upon the user to exercise judgment in the use of the data. The author and publisher do not provide any guarantee, express or implied, with regard to the general or specific applicability of the data, the range of errors that may be associated with any of the data, or the appropriateness of using any of the data in any subsequent calculation, design, or decision process. The author and publisher accept no responsibility for damages, if any, suffered by any reader or user of this handbook as a result of decisions made or actions taken on information contained herein.

# PREFACE

Thermodynamic property data are important in many engineering applications in the chemical processing and petroleum refining industries. The objective of this book is to provide the engineer with such data. The data are presented in thermodynamic diagrams (graphs) covering a wide range of pressures and temperatures to enable the engineer to quickly determine values at points of interest. The contents of the book are arranged in the following order: graphs, references, and appendixes.

The graphs are arranged by carbon number and chemical formula to provide ease of use. English units are used for the property values. For those involved in SI and metric usage, each graph displays a conversion factor to provide the SI and metric units.

The graphs provide wide coverage for volume and enthalpy as a function of temperature and pressure, including the following:

- two-phase region for saturated liquid and vapor
- superheated gas region for gases above saturation temperature
- subcooled liquid region for liquids below saturation temperature
- supercritical region for temperatures and pressures above critical point

The graphs for enthalpy also contain lines of constant entropy to permit engineering usage for 2nd law problems such as adiabatic expansion and compression of fluids.

The coverage encompasses a wide range of organic compounds including hydrocarbons, such as alkanes, olefins, acetylenes, and cycloalkanes; oxygenates, such as alcohols, aldehydes, ketones, acids, ethers, glycols, and anhydrides; halogenates, such as chlorinated, brominated, fluorinated, and iodinated compounds; nitrogenates, such as nitriles, amines, cyanates, and amides; sulfur compounds, such as mercaptans, sulfides, and sulfates; silicon compounds, such as silanes and chlorosilanes; and many other chemical types.

The range of coverage for pressure is from 10 to 10,000 psia. Very limited experimental data are available at pressures above 1,000 to 2,000 psia. Thus, values at the higher pressures should be considered rough approximations. Values at lower pressures are more accurate.

The graphs are based on the Peng-Robinson equation of state (1) as improved by Stryjek and Vera (2, 3). The equations for thermodynamic properties using the Peng-Robinson equation of state are given in the appendix for volume, compressibility factor, fugacity coefficient, residual enthalpy, and residual entropy. Critical constants and ideal gas heat capacities for use in the equations are from the data compilations of DIPPR (8) and Yaws (28, 29, 30).

The literature has been carefully searched in construction of the graphs. References for sources used in preparing the work are given in the section following the graphs near the end of the book.

For the graphs, some of the compounds may undergo thermal decomposition (reaction) at the higher temperatures. For such cases of thermal decomposition, the graphs are useful for ascertaining property values of the pure compound which is contained in the reaction mixture. Chemistry handbooks and DIPPR (8) notes may be used for specifics regarding thermal decomposition.

A list of compounds is given near the end of the book to aid the user in quickly locating compounds of interest from knowledge of the chemical formula or name.

An executable computer program, complete with data files, is available for calculation of thermodynamic properties. For information on the program, contact Carl L. Yaws, Ph.D., P. O. Box 10053, Beaumont, Texas 77710, phone/fax (409) 880-8787.

## Appendix A

### Equations for Thermodynamic Properties

#### Enthalpy

$$H = H_{ref} + \int_{T_{ref}}^T C_P dT - \Delta H^{resid} \quad (1)$$

#### Entropy

$$S = S_{ref} + \int_{T_{ref}}^T \frac{C_P}{T} dT - R \ln\left(\frac{P}{P_{ref}}\right) - \Delta S^{resid} \quad (2)$$

#### Internal Energy

$$U = H - P V \quad (3)$$

#### Helmholtz Energy

$$A = U - T S \quad (4)$$

#### Gibbs Energy

$$G = H - T S \quad (5)$$

#### Parameters

$$C_p = \text{heat capacity of ideal gas} \quad (6)$$

$$H_{ref}, S_{ref} = \text{reference state for ideal gas} \quad (7)$$

$$T_{ref}, P_{ref} = \text{reference temperature, reference pressure} \quad (8)$$

$$\Delta H^{resid}, \Delta S^{resid} = \text{residual enthalpy, residual entropy} \quad (9)$$

## Appendix B

### Peng-Robinson Equation of State for Thermodynamic Properties

#### Equation of State

$$P = \frac{RT}{V - b} - \frac{a}{V(V + b) + b(V - b)} \quad (1)$$

#### Volume

$$V^3 + (b - \frac{RT}{P})V^2 + (\frac{a}{P} - 3b^2 - \frac{RT}{P}2b)V + (b^3 + \frac{RT}{P}b^2 - \frac{ab}{P}) = 0 \quad (2)$$

#### Compressibility Factor

$$Z^3 - (1 - B)Z^2 + (A - 3B^2 - 2B)Z - (AB - B^2 - B^3) = 0 \quad (3)$$

#### Fugacity Coefficient

$$\ln \phi = Z - 1 - \ln(Z - B) - \frac{A}{2\sqrt{2}B} \ln\left(\frac{Z + 2.414B}{Z - 0.414B}\right) \quad (4)$$

#### Residual Enthalpy

$$\frac{\Delta H^{resid}}{RT} = 1 - Z + \frac{A}{2\sqrt{2}B} \left(1 + \frac{D}{a}\right) \ln\left(\frac{Z + 2.414B}{Z - 0.414B}\right) \quad (5)$$

#### Residual Entropy

$$\frac{\Delta S^{resid}}{R} = -\ln(Z - B) + \frac{AD}{2\sqrt{2}Ba} \ln\left(\frac{Z + 2.414B}{Z - 0.414B}\right) \quad (6)$$

#### Parameters

$$a = a_c \alpha \quad (7)$$

$$a_c = 0.45724R^2 T_c^2 / P_c \quad (8)$$

$$b = 0.07780RT_c / P_c \quad (9)$$

$$\alpha = [1 + m(1 - T_r^{1/2})]^2 \quad (10)$$

$$m = 0.37464 + 1.54226\Omega - 0.26992\Omega^2 \quad (\text{original PR}) \quad (11)$$

$$m = \text{see Stryjek, Vera (modified PR)} \quad (12)$$

$$A = aP/R^2T^2 = 0.45724\alpha P_r/T_r^2 = 0.45724 \frac{(P/P_c)}{(T/T_c)^2} \alpha \quad (13)$$

$$B = bP/RT = 0.07780P_r/T_r = 0.07780 \frac{(P/P_c)}{(T/T_c)} \quad (14)$$

$$D = -T \frac{da}{dT} = ma\sqrt{T_r/\alpha} \quad (15)$$

## Appendix C

### Examples for Thermodynamic Diagrams

#### Example 1 - Vessel Pressure

A vessel containing gaseous 1-octene (C<sub>8</sub>H<sub>16</sub>) at 230 psia and 500 F is exposed to a fire in the process area. The temperature in the vessel is 900 F when the fire is extinguished. Estimate the final pressure in the vessel.

Since the vessel size does not change appreciably, this situation may be approximated by a constant volume process. Using the thermodynamic diagram, the initial volume is about 0.24 ft<sup>3</sup>/lb. At this same volume and final temperature, the pressure is:

$$\underline{P_{\text{final}} = 460 \text{ psia}}$$

#### Example 2 - Reactor Size

A batch reactor is to contain 2,000 lb of 1-octene (C<sub>8</sub>H<sub>16</sub>) at 200 psia and 500 F. Estimate the reactor size.

Using the thermodynamic diagram, the volume is about 0.32 ft<sup>3</sup>/lb at these conditions. Substitution of this into the equation below for the reactor size provides:

$$\underline{\text{Reactor Size} = (2,000 \text{ lb}) (0.32 \text{ ft}^3/\text{lb}) = 640 \text{ ft}^3}$$

#### Example 3 - Process Vessel Size

A process vessel is to contain 500 lb of 1-octene (C<sub>8</sub>H<sub>16</sub>) at 100 psia and 500 F. Estimate the process vessel size.

Using the thermodynamic diagram, the volume is about 0.8 ft<sup>3</sup>/lb at these conditions. Substitution of this into the equation below for the process vessel size provides:

$$\underline{\text{Vessel Size} = (500 \text{ lb}) (0.8 \text{ ft}^3/\text{lb}) = 400 \text{ ft}^3}$$

#### Example 4 - Heat Exchanger Duty

1-Octene (C<sub>8</sub>H<sub>16</sub>, 30,000 lb/hr) at 100 psia and 500 F is heated to 900 F and then fed to a plug-flow reactor. Estimate the heat exchanger duty necessary to accomplish the heating.

Substitution of mass flow and enthalpies from the thermodynamic diagram into the equation below provides:

$$\begin{aligned} \underline{\text{Heat Exchanger Duty} = \text{mass flow} (H_2 - H_1)} &= (30,000 \text{ lb/hr})(475 - 200) \text{ BTU/lb} \\ &= \underline{8.25 \text{ million BTU/hr}} \end{aligned}$$

### **Example 5 - Compression**

1-Octene (C<sub>8</sub>H<sub>16</sub>, 20,000 lb/hr) at 10 psia and 500 F is compressed to 4,000 psia. Estimate the change in enthalpy for the compression assuming adiabatic and reversible conditions (constant entropy).

Substitution of mass flow and enthalpies from the thermodynamic diagram into the equation below provides:

$$\begin{aligned}\text{Enthalpy Change} &= \text{mass flow } (H_2 - H_1) = (20,000 \text{ lb/hr})(310 - 210) \text{ BTU/lb} \\ &= \underline{2.0 \text{ million BTU/hr}}\end{aligned}$$

This change in enthalpy represents energy that is required to accomplish the compression under adiabatic and reversible conditions. Under operating conditions, the actual energy that is required for the compression will be somewhat more depending on the efficiency.

### **Example 6 - Expansion**

1-Octene (C<sub>8</sub>H<sub>16</sub>, 30,000 lb/hr) at 8,000 psia and 900 F is expanded to 10 psia. Estimate the change in enthalpy for the expansion assuming adiabatic and reversible conditions (constant entropy).

Substitution of mass flow and enthalpies from the thermodynamic diagram into the equation below provides:

$$\begin{aligned}\text{Enthalpy Change} &= \text{mass flow } (H_2 - H_1) = (30,000 \text{ lb/hr})(280 - 420) \text{ BTU/lb} \\ &= \underline{-4.2 \text{ million BTU/hr}}\end{aligned}$$

This change in enthalpy represents energy that is available from the expansion under adiabatic and reversible conditions. Under operating conditions, the actual energy that is available for the expansion will be somewhat less depending on the efficiency.

## Appendix H

### Computer Program for Thermodynamic Properties

A computer program for calculation of thermodynamic properties using the Peng-Robinson equation of state is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program is executable and complete with data files. The program calculates thermodynamic properties at pressures and temperatures that are input by the user. Representative results are shown below:

COMPOUND: 841 C8H18 n-OCTANE

reference state: datum of ideal gas @ 77 F (25 C)
